1. Selection Sort

Source Code Program Selection Sort :

```
#include <stdio.h>
#include <sys/time.h>
void selectionSort(
   int array[]);
void printArray(
struct timeval stop, start; // membuat struck waktu harus membuat #include <sys/time.h>
    int array[] = {3, 10, 4, 6, 8, 9, 7, 2, 1, 5};
puts("Metode Selection Sort");
    printArray(array);
void printArray(int array[])
    printf("]\n");
void selectionSort(int array[])
         int min = i;
for (int j = i + 1; j < size; j++)</pre>
               if (array[j] < array[min])</pre>
          if (temp != array[min])
              array[i] = array[min];
array[min] = temp;
    printf("]\n");
```

```
printf("\nDurasi %lu ms\n", (stop.tv_sec - start.tv_sec) * 1000000 + stop.tv_usec -
start.tv_usec);
    printf("Jumlah penukaran = %d\n", penukaran);
    printf("Jumlah perbandingan = %d\n\n", perbandingan);
}
```

Output Source Code Selection Sort :

```
Metode Selection Sort
Array Awal = [ 3 10 4 6 8 9 7 2 1 5 ]
Array hasil = [ 1 2 3 4 5 6 7 8 9 10 ]

Durasi 997 ms
Jumlah penukaran = 7
Jumlah perbandingan = 45

Process returned 0 (0x0) execution time : 0.015 s
Press any key to continue.
```

2. Insertion Sort

Source Code Program Insertion Sort :

```
#include <stdio.h>
#include <sys/time.h>
void insertionSort(
    int array[]);
    int array[]);
int main()
     int array[] = {3, 10, 4, 6, 8, 9, 7, 2, 1, 5};
puts("Metode Insertion Sort");
     printArray(array);
struct timeval stop, start; // membuat struck waktu harus membuat #include <sys/time.h>
void printArray(int array[])
     printf("Array Awal = [ "); // data array 1 - 4 akan dipanggil kedalam sini
for (int i = 0; i < size; i++)</pre>
           printf("%d ", array[i]);
     printf("]\n");
void insertionSort(int array[])
     int i, j, x;
for (int i = 0; i < size; i++)</pre>
                 while (x < array[j])
                       array[j + 1] = array[j]; // pindahkan elemen tsb ke 1 posisi
                 if (array[j + 1] != x)
                       array[j + 1] = x; // assign temp kembali ke array
           printf("%d ", array[i]);
```

```
printf("]\n");
  gettimeofday(&stop, NULL); // waktu mulai berhentinya jalan sorting
  printf("\nDurasi %lu ms\n", (stop.tv_sec - start.tv_sec) * 1000000 + stop.tv_usec -
start.tv_usec);
  printf("Jumlah perbandingan = %d\n", perbandingan);
  // printf("Jumlah pergeseran = %d\n", pergeseran);
  printf("Jumlah penyisipan = %d\n\n", penyisipan);
}
```

Output Source Code Insertion Sort:

```
Metode Insertion Sort
Array Awal = [ 3 10 4 6 8 9 7 2 1 5 ]
Array hasil = [ 1 2 3 4 5 6 7 8 9 10 ]

Durasi 997 ms
Jumlah perbandingan = 9
Jumlah penyisipan = 8

Process returned 0 (0x0) execution time : 0.811 s
Press any key to continue.
```

3. Analisa terhadap no 1 dan 2. terkait jumlah perbandingan, jumlah penukaran dan waktu komputasi.

	Selection Sort	Insertion Sort
Perbandingan	45	9
Penukaran	7	8
